INFORMATION RELEASE – May 31, 2020

COVID 19 DECONTAMINATION AND DISINFECTION SERVICES

While many organizations are just now learning about the processes and equipment for disinfection based on the recent outbreaks, SR&R has been providing environmental decontamination across the Southeast for almost 30 years. “Decontamination” can mean a lot of different things depending on the audience. Some people use the term to refer to removing bulk contaminants (like in tank cleaning) while others may mean the chemical or cleaning for biological disinfection as in a Coronavirus decontamination. Many of the same concepts, approaches, safety concerns, and personal protective equipment (PPE) are similar, and transition directly to the principals of disinfection for coronavirus 19 situations.

Over the past several months, SR&R has been called upon to use its expertise to provide services to both private and public sector clients for the decontamination of facilities. We were called upon for one particularly interesting assignment by a major medical service complex to disinfect all their emergency vehicles 24 hours per day and 7 days per week to insure that virus contaminants weren’t passed from one emergency run to the next.

Now as we “return to normal” it becomes more important that facilities ranging from food services to educational and governmental buildings to heavy industry and everything in between ascertain that their operations are clean and not a source of any future spot outbreaks.

Along with its other environmental cleanup and remediation activities, SR&R continues to service the general public and private sectors to disinfect facilities that are opening up and operating once more, and giving the assurance that re-populating buildings and businesses into a sanitized environment will help prevent any new or future re-infections.
